

Lab Task 7: LINQ Operations on Employee Data

Objective:

Use LINQ query and method syntax to filter, sort, project, and analyze a list of Employee objects.

Employee Class Structure:

```
class Employee
{
    public string Name { get; set; }
    public double Salary { get; set; }
    public string Department { get; set; }
    public bool IsResigned { get; set; }
    public int Experience { get; set; }
}
```

Tasks:

1. Given a list/array of Employee objects, retrieve only the employees who are currently working (i.e., IsResigned == false).
2. Sort the list/array of employees by their Salary in descending order.
3. Extract a list of distinct Department values from the employees.
4. Check if any employee has zero years of experience.
5. From the employee list/array, create a new list containing only the Name and Salary properties.
